Raphael Motta

Embbded AI Engineer | Multi-Agent Systems • LLMs • LangGraph • Agent Harness | Cloud-native 0 to 1 Systems @ (AWS, Azure, GCP)
São Paulo, São Paulo, Brazil

Summary

I am just a guy with a curious fascination about technology. Results-driven AI Engineer with 5+ years of experience architecting and deploying scalable, high-availability solutions. Key Achievements:- Architected event-driven microservices connected to Agents processing 2M+ daily API calls with 99.9% uptime on Kubernetes. - Engineered AI Agents that reduced platform complexity for users, contributing to a 5% reduction in churn within the first month.- Developed memory layers for AI Agents using Neo4j for Graph Knowledge and reducing hallucinations.- Created a multi-agent workflow to help developers to understand their career momment, using LangGraph.- Accelerated legacy code migration by weeks by creating an AI Agent to automate endpoint refactoring.- Optimized a RAG system with sensitive financial data using Embedding Cache on Redis and the adoption of a Router Agent to create agentic RAG instead of a basic implementation, optimizing token usage for each response cycle in about 40% and updating the response inference by 60% after the first optimization, also updating data visualization in real time with DataDog. Technical Proeficienies: Gen AI: Pydentic AI, LangChain, LangGraph, CrewAI, LLMs, PyTorch, AWS SageMaker, AWS Bedrock, MCPs, Cognee, Neo4j, FalkorDb, Multi-Agent Orchestration, Vertex AI Backend: Python (FastAPI), Go (Gin), Node.js, Distributed Services, Microservices, CQRS, Event-Driven Architecture, Circuit Breaker, Unit of WorkCloud DevOps: AWS (CloudFormation, EKS, ECS, Lambda, S3, RDS, DynamoDB, SNS, SQS), Docker, Kubernetes, Terraform, CI/CDData/Messaging: Kafka, NATs, RabbitMQ, Redis, SQL Server, MySQL, PostgreSQL, MySQL, MongoDB, CosmosDB

Experience

Umbrage

AI Engineer

June 2025 - Present (1 year 2 months)

Houston, TX

- Acted as an AI-Specialist consultant improving RAG systems by 20% (LangGraph, Pinecone) and agent performance for large-scale workflows in financial companies (BTG Pactual, Itau)
- Delivered a multi-tenant solution focused on distributed-service architecture on a serverless scale in AWS, preparing it to scale in a horizontal way for several new tenants with their applications. (Weatherford International)
- Designed a multi-agent ecosystem with LangGraph to create an expert Router and smaller specialized agents to handle logistic and HR processes.
- Created enterprise-grade Generative AI Solutions for large banks as a consultant, mapping complex documentations and domain logic to create ontologies via Neo4j and produce agentic effects inside the platforms like trades and taxes payment. (BTG Pactual, Itau)
- Optimized a RAG system with sensitive financial data using Embedding Cache on Redis and the adoption of a Router Agent to create agentic RAG instead of a basic implementation, optimizing token usage for each response cycle in about 40% and updating the response inference by 60% after the first optimization, also updating data visualization in real time with DataDog.
- Developed a Data Pipeline for OCR operations with Docling to receive confidential financial documents and transform them into embeddings inside a Vector Store for further consumption inside a chatbot. The Data Pipeline endpoint was in a FastAPI endpoint for application consumption, using Terraform to use Infra as Code for the project and AWS S3 to store the processed data files.

All Integra

4 years 3 months

AI Engineer

April 2023 - June 2025 (2 years 3 months)

- Deployed a multi-agent AI ecosystem for digital product classification and improvement, resulting in 10% more sales and 30% less churn in the first month of launch.
- Created a workflow responsible for correlating and integrating correctly customers' products through different e-commerces with Agentic RAG and

Knowledge Graphs about the product database and e-commerce's rules to create, refine and improve products. Orchestrated with LangGraph, hosted in ECS, Qdrant as a Vector DB, Neo4j for Graph DB and Cognition as ECL processor.

- Orchestrated autonomous workflows with LangGraph and Pinecone for high-speed vector retrieval, automating critical product improvement classifications.

- Designed migration agentic pipelines in the format of a development ecosystem, mapping the old codebases via Neo4j ontologies to empower agentic reasoning for coding migrations.

Software Engineer

April 2021 - April 2023 (2 years 1 month)

- Architected 15+ e-commerce integrations (Amazon, Shopee, Mercado Libre, TikTok Shop) with an event-driven approach (RabbitMQ, Redis), processing over 2M+ daily API calls with about 99% uptime. (Kubernetes)

- Progressed from junior to mid-level engineer, creating logistic tools for e-commerce, integrating with the Software using AWS services (Lambda, S3, SQS/SNS).

Education

Universidade Veiga de Almeida

Bachelor of Engineering - BE, Computer Engineering · (April 2022 - April 2027)
